

NEW HYPERTENSION TREATMENTS

GIVE PATIENTS OPTIONS

More than 100 million Americans have hypertension. Nearly a third have uncontrolled hypertension—when a patient is taking 3 or more medications with little blood pressure improvement.

Uncontrolled high blood pressure can be deadly.

New treatment options could help.

One example is a device-based procedure called renal denervation. Recently approved by the FDA, renal denervation is shown to be effective at reducing blood pressure, especially alongside medications.¹

With timely access to the full range of treatment options, patients and health care providers can get stubborn high blood pressure under control.
